TITLE : AIR CONDITIONING DEVICE

ABSTRACT : PROBLEM TO BE SOLVED: To provide an air conditioning device which can prevent the generation of dewing on a surface of a device to be cooled in advance.

SOLUTION: An air conditioning device which carries out a volume control of a compressor so as to make a blow-off air temperature reach a target value includes a temperature sensor 10 and a humidity sensor 11 for detecting temperature and humidity of air surrounding a device to be cooled. Based on the detected results of these sensors, a device dew point temperature of the air surrounding the device is calculated. If the blow-off air temperature is lower than the device dew point temperature, a warning display device 12 makes a warning that dewing may be generated on the surface of the device to be cooled. Accordingly, any troubles on electronic components which may be generated owing to dewing on the device can be prevented in advance.
